Case study: Deep wound

- Patient history:** A miniature horse presented with a large, deep wound extending onto the bone.
- Treatment:** Light therapy was done **once a day** using the **0 - 21 day protocol** together with bandages, but no other medication was used.
- Outcome:** The wound healed **without any proud flesh** formation. Good granulation tissue and epithelial tissue formed leaving almost **no scar tissue** behind. The horse recovered sooner than expected (within 2 weeks) with no complications.

Presenting wound

3 days later

6 days later
Good granulation tissue and epithelialisation

9 days later

13 days later
No scar tissue or proud flesh
